PRODUCT REVIEW / MARCH 2026

AlphaBioHack product presentation

A current-state product deck built from the live application surface, route inventory, feature flags, and local UI review. This deck reflects what the product is today, what it does well, and what should come next.

Public website **Guided booking** **Practice operations** **Bilingual brand control**

Prepared from code audit + local UI capture

PRODUCT SNAPSHOT

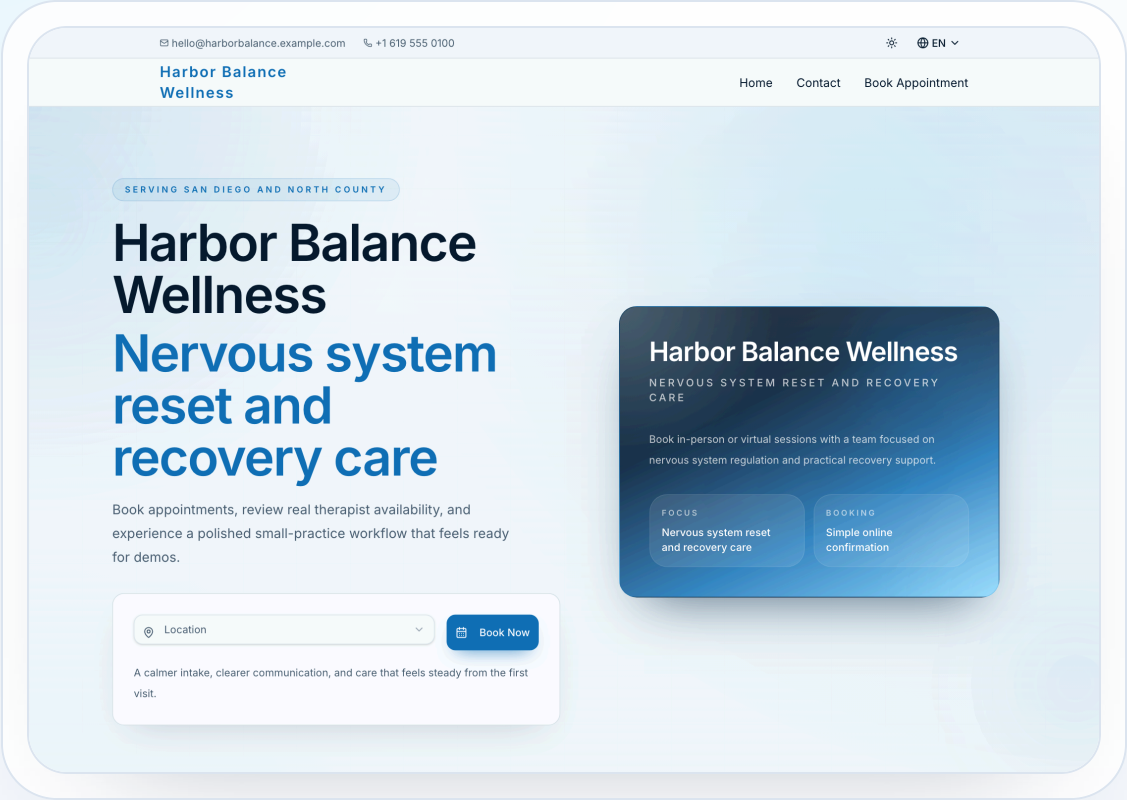
What the product already is

AlphaBioHack is already more than a booking form. It combines a branded public website, a conversion-focused booking flow, and a practical operations workspace for a small therapist-led practice.

PUBLIC EXPERIENCE

Branded public site with real conversion intent

The public experience is polished enough for demos and real practice use. It already feels like a modern small-practice site, not just a utility workflow.



Localized by default

Public pages and content support English and Spanish routes today.

Brand-controlled

Company-managed logos, summary, contact details, hours, and landing-page copy.

Conversion-ready

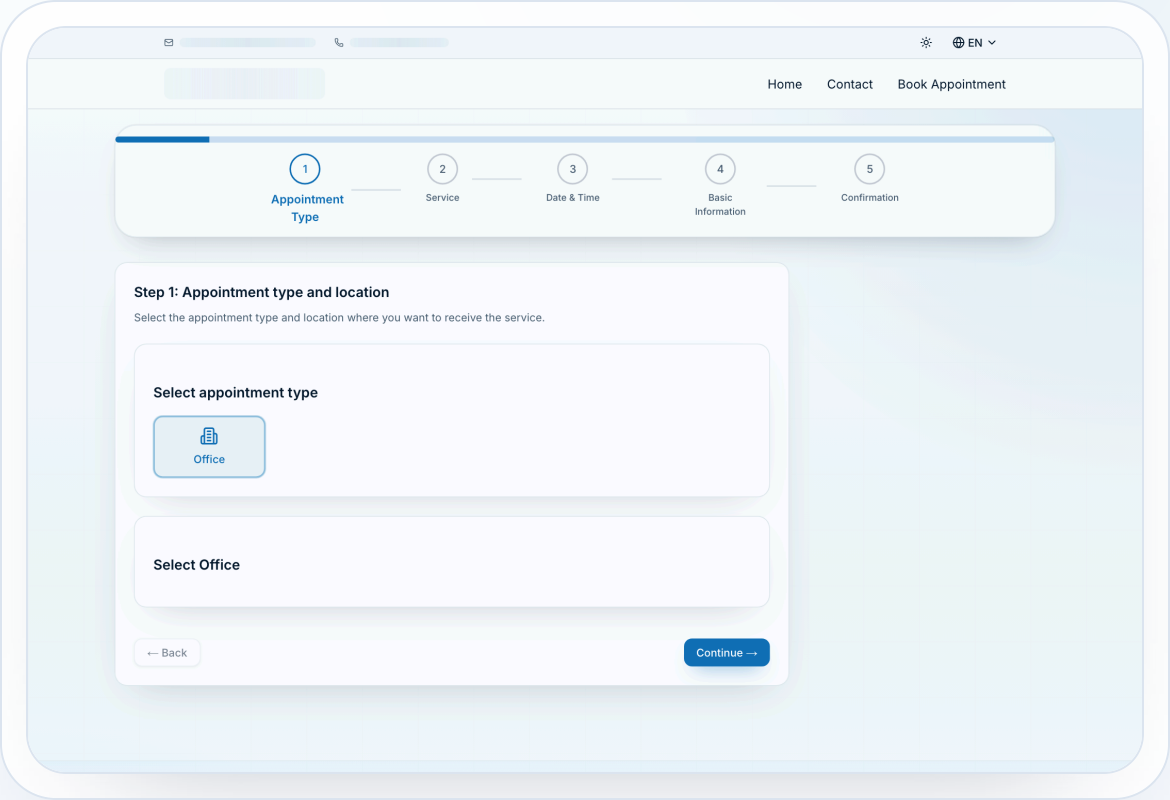
Clear booking entry points, contact pathways, and a polished visual system.

Public routes: home, contact, auth

BOOKING FLOW

A guided booking wizard that feels production-ready

The booking flow is one of the strongest parts of the product. It combines structure, slot validation, therapist-aware availability, and patient data capture without feeling heavy.



PRACTICE OPERATIONS

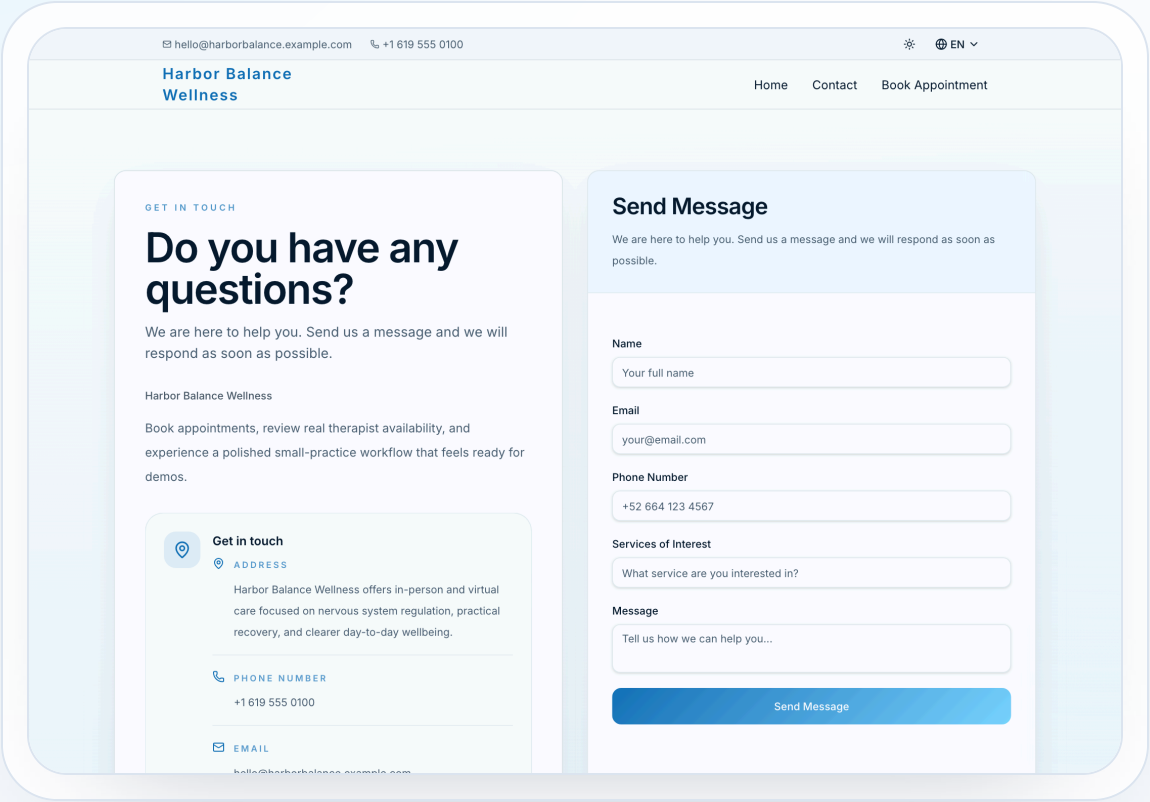
Internal workspace covers the core operating loop

Beyond booking, the protected workspace gives a small practice enough control to operate scheduling, staff, catalog, and public presence from one system.

BRAND AND CONTENT CONTROL

The company area already behaves like a lightweight site builder

Company settings now go beyond contact details. The app supports landing-page editing, localized copy overrides, and preview workflows that make the site feel customer-manageable.



Landing-page builder

Section visibility, localized copy, preview, and sticky/modal preview flow.

Public content controls

Brand logos, summary, specialty, hours, social links, and contact data.

Why it matters

The product can be positioned as website plus booking plus operations, not only scheduling.

Strong differentiator for a small-practice audience

AUTH AND INFRASTRUCTURE

Clear separation between infrastructure and product ownership

The current architecture is cleaner than before: Supabase handles infrastructure, while the app owns users, sessions, password reset, and staff management.

DEMO AND SALES READINESS

The product now has a believable demo environment

A realistic seed makes the app usable in sales calls and stakeholder walkthroughs without relying on synthetic e2e-only data.

ROLES AND ACCESS

The current product uses four application roles, plus a company membership layer. In practice, the operating model is clear: patients book, front desk operates appointments, therapists run the practice workflow, and admins have broad internal access.
